

The Medulloblastoma Initiative (MBI) raises private donations to enable world-class scientific research that will find the cure for medulloblastoma, the most common brain cancer in children, affecting 15,000 kids every year.

Kids with brain tumors were left behind

- Very limited funds are available for pediatric cancer research, considered a rare disease.
- The current treatment for medulloblastoma is from the 1980s. It is highly toxic and ineffective.
- Thousands of kids die and the survivors have severe lifelong effects.

Our secret is collaboration and laser-focus

- By aligning with Children's National Hospital and Dr. Roger J. Packer, one of world's foremost specialists in medulloblastoma, the MBI was established in 2021.
- Scientists from North America and Europe currently work synergistically in 14 labs with one single focus: finding a cure for medulloblastoma.

Together we can change this sad picture through philanthropy

- Only 2.5 years after the Initiative was established — an unprecedented time — two clinical trials for innovative medulloblastoma treatments have been approved by the FDA, and with one of them having started in May 2025.
- Each clinical trial has an estimated cost around 1 million USD.
- We need your help to keep funding the research and saving the lives of kids with brain tumors.
